Summary

Electrical and Electronics Engineering undergraduate specializing in Embedded Systems, IoT, Power Electronics, and Electric Vehicle technologies. Builder with hands-on experience designing hardware-software integrated systems and early-stage technical products. Co-founder contributing to product architecture, feature planning, and iterative engineering development. Passionate about scalable engineering systems, intelligent energy solutions, and real-time embedded applications.

Education

CHRIST (Deemed to be University)

Bachelor of Technology (B.Tech) in Electrical and Electronics Engineering

Honours Specialization: Electric Vehicles

2024 – 2028

Bengaluru, India

Experience

Co-Founder — Verblyn Labs
India

Dec 2025 – Present

- Contribute to product direction, feature architecture, and platform planning for early-stage development.
- Support research, user feedback collection, and usability improvements for product features.
- Collaborate in testing workflows, documentation, and iterative engineering processes.
- Helped shape the first functional version of the AQMD platform and establish a structured development environment.

Projects

Hybrid Energy Storage System for Electric Vehicles

- Designed a hybrid storage architecture combining batteries and supercapacitors to improve EV power delivery and transient response.
- Implemented energy management logic for optimized power distribution.
- Built documentation and technical visualization platform.
- GitHub Repository: <https://github.com/KUKI-Boi/hybrid-energy-storage-system.git>
- Website: HESS

Altitude Hold Controller for Aircraft

- Designed a feedback control system to maintain stable aircraft altitude.
- Implemented simulation models using MATLAB and Simulink control system frameworks.
- Tuned PID control parameters to achieve stable system response.
- GitHub Repository: github.com/KUKI-Boi/altitude-hold-controller

Smart Water Flow Monitoring and Billing System (IoT)

- Developed an embedded IoT system to measure and monitor water consumption in real time.
- Integrated flow sensors, microcontroller, RTC module, and OLED display.
- Implemented real-time billing calculations based on water usage.
- Enabled wireless communication for remote monitoring and logging.

Power System Analysis Tools

- Developed MATLAB-based tools for automatic Y-Bus and Z-Bus matrix construction.
- Implemented interactive scripts for electrical power system network analysis.
- Designed user-input driven matrix generation for educational simulations.

Technical Skills

Programming: MATLAB, Embedded C, Arduino

Engineering Tools: MATLAB/Simulink, Git, GitHub, LaTeX

Domains: Embedded Systems, IoT Development, Energy Storage Systems, Electric Vehicles, Power Electronics, Control Systems

Hardware: Microcontrollers, Sensors, RTC Modules, Wireless Communication Interfaces

Certifications

- AI for Students: Build Your Own Generative AI Model
- CICADA 2025 – 24-Hour Hackathon
- Hackathon 2025
- Ohm-azing Build-a-thon
- Introduction to Internet of Things

Languages

English (Professional Working)

Kannada (Native/Bilingual)

Hindi (Native/Bilingual)

Malayalam (Limited Working)

Tamil (Professional Working)

Telugu (Elementary)

Marathi (Native/Bilingual)
